

CELTIC SEA AND WESTERN CHANNEL COD

Divisions 7.e-k & 7.b,c

ADVICE FOR 2024

ICES advises that when the MSY approach and precautionary considerations are applied, there should be zero catch in 2024. ICES notes the existence of a precautionary management plan, developed and adopted by one of the relevant management authorities for this stock.

ICES does not provide advice for cod in 7.b.c. Average reported landings in the last 3 years (2020-2022) was 22.5 t.

KEY POINTS

ICES Assessment Category	I (Quantitative Assessment)	
Management Plan	WWMAP (target)	
Advice Basis	Management Plan	Catch=0 t
Ranges	F _{MSY} Range Lower	Catch=212 t
	F _{MSY}	Catch=343 t
	F _{MSY} Range Upper	Not applicable
Landing Obligation	From 2019	No derogations or exemptions

MANAGEMENT IN 2023

- The assessment area covers 7.e-k, with inclusion of catch from the south Irish Sea (7.a; ICES rectangles 33E2 and 33E3). This does not correspond to the TAC management area of 7.b-c, 7.e-k, 8, 9 and 10; Union waters of CECAF 34.1.1. The 2022 reallocation of 30 t accounted for 23% of Irish Sea (Division 7.a) landings and 5% of Celtic Sea (Divisions 7.b-k) landings.
- Cod in 7b,c are not assessed by ICES but are within this TAC area.
- Since 2005, ICES rectangles 30E4, 31E4, and 32E3 have been closed during the first quarter as part of the Celtic Sea Conservation area (Appendix VII).
- Since June 2020, a number of additional technical measures were introduced in parts of the Celtic Sea, including raised footropes and changes to mesh sizes, with the aim of reducing by-catch of cod in fisheries targeting other species.
- The TAC is exclusively for bycatches of cod in fisheries for other species. No directed fisheries for cod are permitted under this quota.

KEY STOCK CONSIDERATIONS

- Because of the very low stock size and continued high mortality, the short-term stock development is very sensitive to incoming recruitment. The assumed recruitment in 2023 and 2024 used in the forecast constitutes a significant part (75%) of the projected SSB in 2025.
- The estimate of fishing mortality is highly sensitive to new data being added each year; this is due to the low stock size.
- Most Irish catch is taken as a minor bycatch throughout the Celtic Sea. This makes it difficult to control the fishing mortality on the stock in mixed fisheries.
- In recent years ICES has provided a technical service on “unavoidable bycatches” of cod in the Celtic Sea based on a mixed fisheries analysis. It is likely that cod will continue to be the primary “choke” species for most Celtic Sea fleets in 2024.
